

The innovative project «Light water».

Phenomenon of light water

The most phenomenal opening of the first 10-years the XXI-st centuries consists that only bio logically active water cleared on molecule level, is capable to resist successfully to illnesses, to treat and to rejuvenate an organism, improving working conditions of cages, various bodies and systems. To be curative, water should be not only pure, but also **easy!**

WATER - the most important substance on the Earth, connecting us with the Nature in one single whole! The human body on 65 % consists of water.

- the Baby, being born, consists of water almost on 85 %.
- Maturing, we lose water, we "dry out".

- The organism of the adult person contains on the average 60-65 % of water, and after 60 years - already only 50 %. The age mechanism is, first of all, loss by a moisture organism!
- At sharp reduction of consumption of water, there is an organism dehydration, and the forehead of eyelids falls ill.

Water - not only a component of cages and body fabrics, but also that *environment* in which all vital processes of an organism proceed.

Our organism - unique self-adjusted system.

It can is independent, without any intervention from our party to resist illnesses, to regulate a metabolism and to make self-updating of cages.

For normal work it is necessary for it to create the favorable environment - qualitative and clear potable water!

• **The person and its health is a quality of water which he drinks within day!**

What potable water is the most qualitative, as much as possible useful for life activity of our organism?

According to spent within the limits of the program «Pure water for Russia» to interrogation, the overwhelming majority of people answers such question approximately so:

- It is pure, transparent, without impurity and unpleasant smells, pleasant to taste, cool, freshening, well, spring water.

It organoleptic, subjective perception the person of concept «pure water». It is exploited today by the manufacturers strenuously advertising various kinds bottle of potable water from "curative" sources, and also «the clearing most advanced stage».

Actually "medical" influence of chemically cleared potable water on an organism is intentionally exaggerated by manufacturers bottle the waters, interested in increased its consumption.

The science confirms modern knowledge: potable water from a waterpipe, artesian chink, a well, a bottle in a supermarket, cleared and even transparent by sight and without an unpleasant smell, can help nothing to our organism!

From the chemical point of view any natural water represents a solution of various elements: mineral salts of various concentration, gases, bacteria and microorganisms, with quantity which defines individual properties of water.

Waters, in which maintenance of these components above, than in usual potable water, is called the mineral.

Despite the advertising statement, any mineral or any another drinking bottle water does not introduce substances necessary for a life in our organism!

The person, unlike plants, does not possess ability to acquire dissolved in at native water inorganic mineral substances.

Besides, natural water of mineral sources contains minerals and microcells at 30-40 time less, than them contains in animal and vegetative food.

For this reason mineral water, natural or bottle, can render on organism the person time toning up influence, but simultaneously with it quite often brings components harmful to it.

At the same time regular consumption of potable water of high degree of physical and chemical clearing, leads to a lack of an organism of necessary elements and, as consequence, to biggest risk of variety of diseases.

The potable water cleared at physical level, even transparent and pleasant on taste, is not molecule pure also does not render considerable influence on ability to live of our organism. It is possible to speak only about its relative safety.

The most phenomenal opening of last decade consists that **only biological the active water cleared at molecular level, is capable to resist successfully to illnesses, to treat and to rejuvenate an organism, improving working conditions of cages, different bodies and systems.**

• **That water which we drink every day, with molecular opinion?**

Long time all and everywhere considered, that water - the elementary individual connection, designating with formula H_2O .

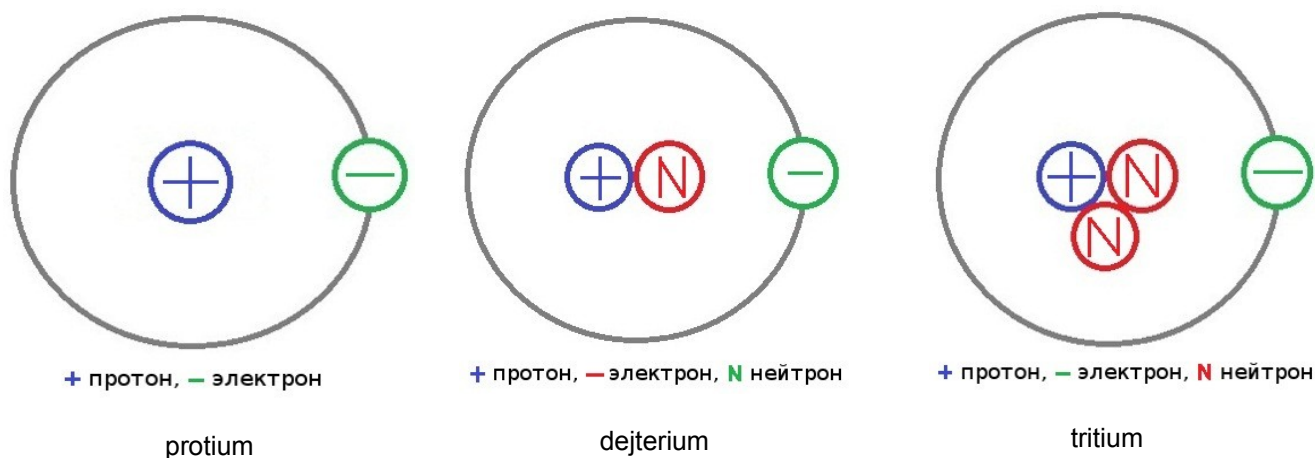

XX-th century basic researches have shown: waters which we habitually call H_2O , in the nature do not exist!

Any natural water is a difficult combination of isotopes of hydrogen and oxygen.

• On 99,7 % it consists of the water consisting of two atoms of a lung (on the nuclear weight) hydrogen 1H (protium) and one atom of easy oxygen ^{16}O .

• Such water scientists name easy. All water on a planet the Earth to some extent is easy water.

• As an impurity in any natural water everywhere and constantly there is also the "heavy" water containing heavy and radioactive isotopes, including deuterium D_2O - a heavy isotope of hydrogen, tritium and "heavy" oxygen.

• **Heavy water in the pure state is poison for all live!**

In one liter of any natural water which we daily use, besides chemical impurity contains about 2,33 of "heavy" water.

In what threat deuterium for an organism?

Among all stable isotopes isotope effects deuterium on live organisms the highest.

On chemical properties deuterium it is identical to atom of hydrogen and at hit in an organism it is capable to replace it in all vital exchange reactions and connections, including chains RNA and DNA.

It can lead to failures in work of various systems of an organism as biologically such replacement is far not equivalent.

Studying effects of influence of light (easy) and heavy water on live organisms, scientific have come to sensational conclusions:

- the Live cage is capable to react even to hardly appreciable changes of the maintenance deuterium in water.
- the Lowered maintenance deuterium in water stimulates vital processes.
- the Raised concentration in water deuterium and other heavy isotopes is extremely dangerous to all live.

Heavy water also depresses development of the higher plants, and if them to water in distant, on half

consisting of heavy water, growth completely stops.

To experimental animals gave to drink water, 1/3 which part has been replaced by heavy water. Through unlonged time animals perished as a result infringement a metabolism.

Heavy water, is non-uniformly distributed in world waters of the Earth. It is connected with temperature of various areas of the Earth and their remoteness from the centers of ecological pollution.

• ppm - a unit of measure of "ease" of water - quantity of particles deuterium on 1 million particles.

Internal deserts Saharas of water - the heaviest - **180 ppm**

The sea, ocean - **155.76 ppm** (V-SMOW - the Viennese standard of ocean water)

Ice of Greenland - **125 ppm**

Thawed snow and snow of high-mountainous glaciers (6000-7000) - **128-132 ppm**

Water in Moscow - **142 ppm**

Central European water - **149-150 ppm**

Arab Emirates - **154 ppm**

Essentially the maintenance of heavy water on 10-12 % is more useful some water which we usually drink - thawed snow of high-mountainous glaciers, in it more low. Not casually among mountaineers who drink it regular, it is much more long-livers, than among inhabitants of the big cities.

Ices of Antarctica - the easiest water on the Earth - **90 ppm**

Natural light water in depths of bowels, in springs, wells or wood lakes - is not present

The maintenance deuterium in various natural waters changes from **90 ppm** (water from Antarctic ice - the easiest natural water) to **180 ppm** - waters in gas layers and closed in layers of Sahara.

In its closed reservoirs it is more, as in comparison with usual water it evaporates more intensively. Heavy water most of all in districts with a hot climate: on equator and in tropics, less. The share deuterium and in ices of Greenland is insignificant.

The mite in distribution of heavy water is brought by a frequent atmospheric precipitation which time carries deuterium on a planet.

The surface of world ocean is enriched deuterium differently, but deep water is rather stable on the isotope structure.

The maintenance of heavy isotopes of hydrogen and oxygen in natural waters is supervised by three international standards:

- Besides the standard Viennese standard SMOW corresponding to deep water of the World ocean exist still the standard of water from Greenland ice;
- Standard SLAP corresponds to natural water from Antarctic, the easiest natural water on the Earth.

Today we are compelled to consume daily the water which cleanliness is only different degree of molecular "impurity".

It is impossible to give to drink all wishing by vivifying easy water, extracting it on inaccessible heights over 6000-7000 m or in ice deserts, practically.

Myths and legends of the different people have informed to us immemorial dream of people of the water of life, capable to cure illness, to give to the person a fresh youth and even immortality.

• **That disappears behind myths and legends about live and dead water?**

Protogenic pure and water of life is capable treat and to rejuvenate.

• **But as we see, traces of natural "live" extra-light water in depths of bowels, in springs, wells or wood lakes - is not present!**

But they are present in a human body which is guided in the ability to live by easy isotopes which in the nature it is more.

• Fats of which are formed lipid cellular membranes, are impoverished deuterium (131 ppm), in comparison with that water (142 ppm and above) which we consume from environment and this water fills intercellular space of our organism.

• In extreme conditions of strong stress and adverse external influences for mobilisation of vital forces the organism is first of all released from heavy isotopes, including from deuterium and heavy oxygen.

Our organism gives us a solution of "a life code». Unusual blossoming of an advanced life on the Earth during the most ancient times has provided **live - light water** in which structure deuterium and heavy isotopes it was essential less than their modern level.

• **It is obvious, that potable water at that level of cleanliness and ease which is accessible to us in the nature, today optimum for normal ability to live we any more is not go an organism!**

Level deuterium in natural water shows is abnormal high for human health fluctuations.

Massive damage of a genetic fund by radioactive and heavy isotopes of hydrogen and oxygen waters puts notable threat to plants, animals and the person!

Long-term researches have confirmed: gradual accumulation in a human body of heavy isotopes of hydrogen and oxygen from consumed water:

- leads to its imperceptible poisoning of an organism;
- Eventually causes various illnesses, including a cancer;
- Damages genes, promotes the accelerated aging.

In the beginning of XXI-th century among a scientific world voices that threatens the person killed if it does not pass to the use of the light water cleared of heavy isotopes deuterium ^2H and oxygen ^{18}O were distributed. For this reason water treating at molecular level from deuterium, and through it and human body liquids, draws recently attention of the increasing number of researchers.

The methods of mechanical, chemical, biological clearing used at manufacturing of usual potable water, are capable to remove only undesirable chemical impurity, but not heavy water!

• Only clearing of natural water at molecular level is capable to improve quality of potable water considerably. For today it is possible to confirm safely: any other means for reception of rather pure water at the person does not exist!

• To be curative, water should be not only pure, but also easy!

Researches of last decade have shown:

Light water with the lowered maintenance deuterium - the most powerful bio-stimulator, improving functionality of an organism at cellular level and possessing powerful medical properties!

Even superficial (on 5-10 %) water treating from deuterium (heavy water) is good capable but to improve it, giving to water immun-stimulation and rejuvenating properties, let alone deep water treating.

Consuming water in which contained deuterium on 25 % below norm, pigs, rats and mice have given posterity, is much more numerous and is larger usual, and egg manufacturing has improved twice.

Wheat with which watered with light water, has ripened earlier and has given higher crop.

Problem of quality of consumed potable water today is one of the central places in state politician of the different countries, including in the CIS countries where there are regions in which to half of all illnesses are connected with the use harmful for health waters.

Experts confirm: transition on using pure water will increase life expectancy of Russians by five - seven years.

Device photos on manufacture of easy water.

On the device shown in photos it is possible to make the purest light water - under the residual maintenance deuterium to 0 ppm. The device has constructive and technological know-how.
